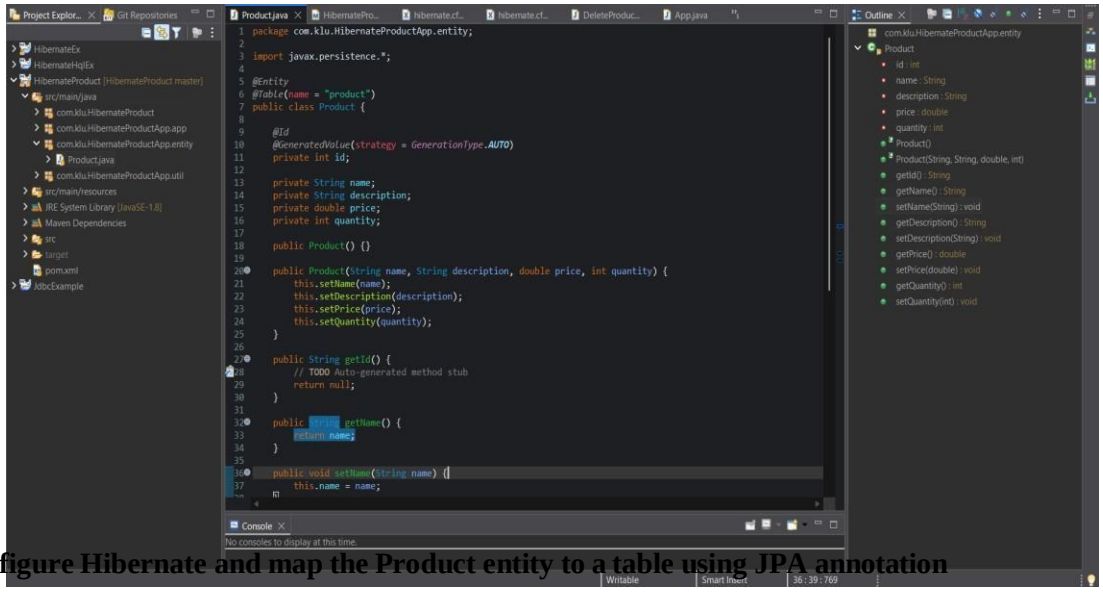
#SKILL – 2 Hibernate CRUD Operations

Tasks:

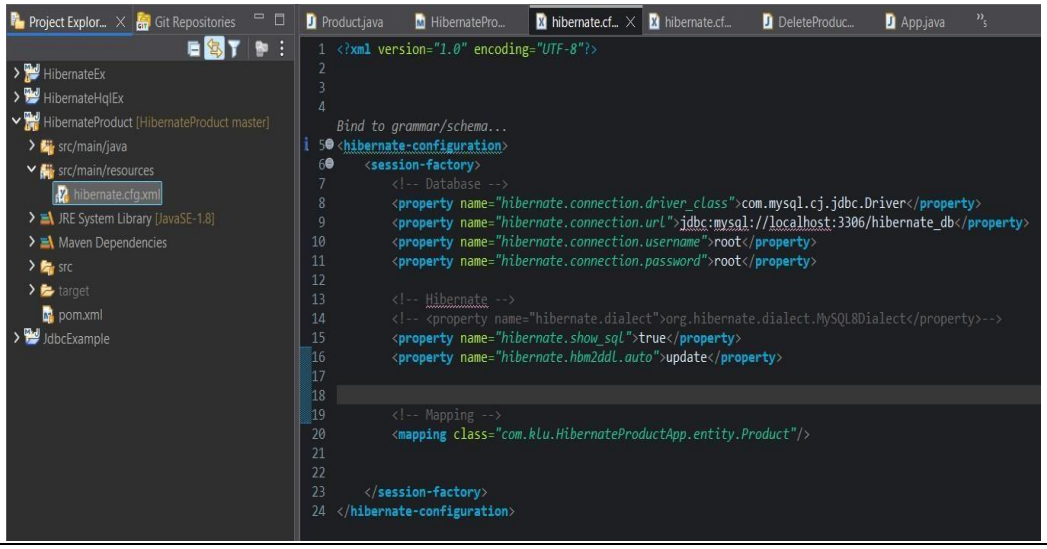
1. **Create a Product entity with fields: id (primary key), name, description, price, quantity.**

Output:-



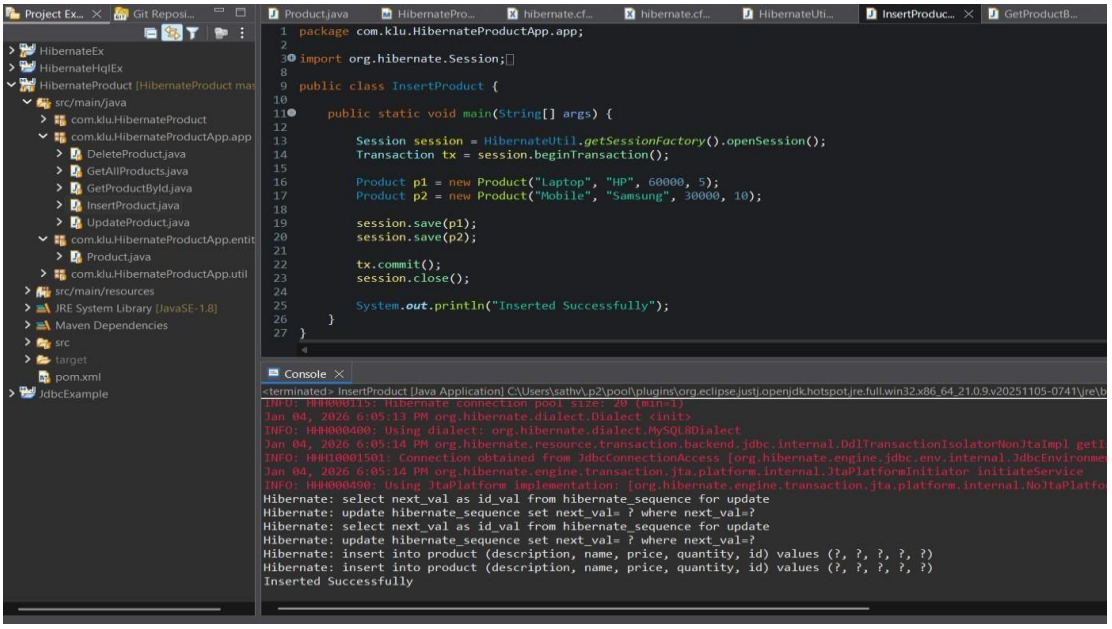
2. **Configure Hibernate and map the Product entity to a table using JPA annotation**

Output:-



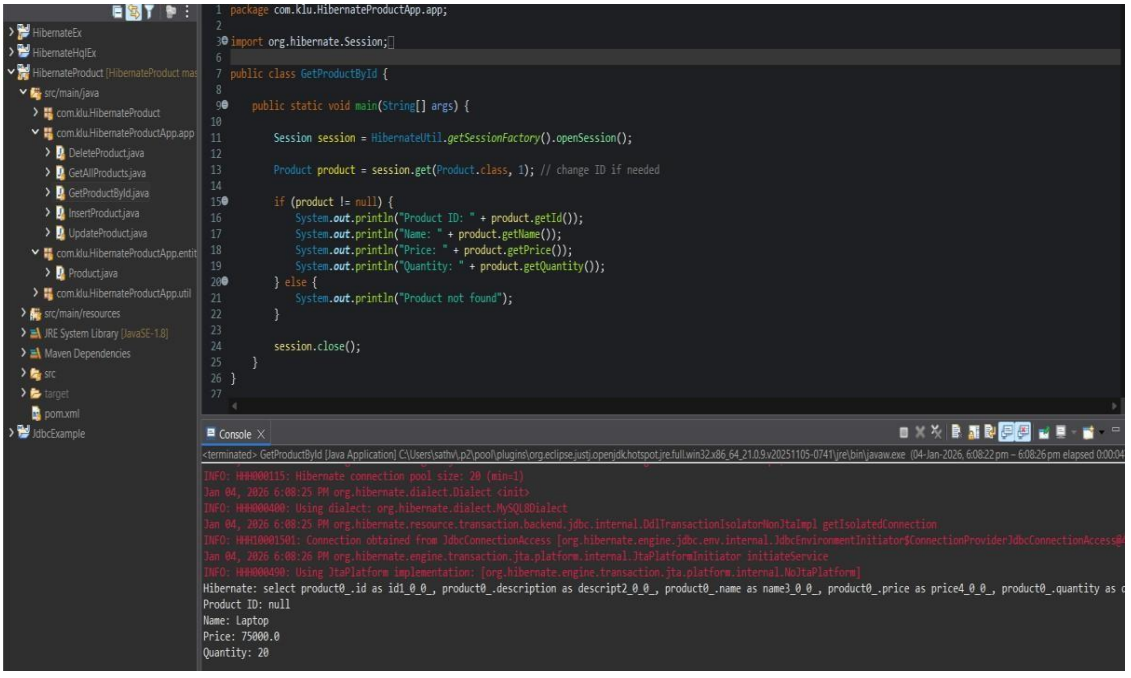
3. **Insert multiple Product records into the database.**

Output:-



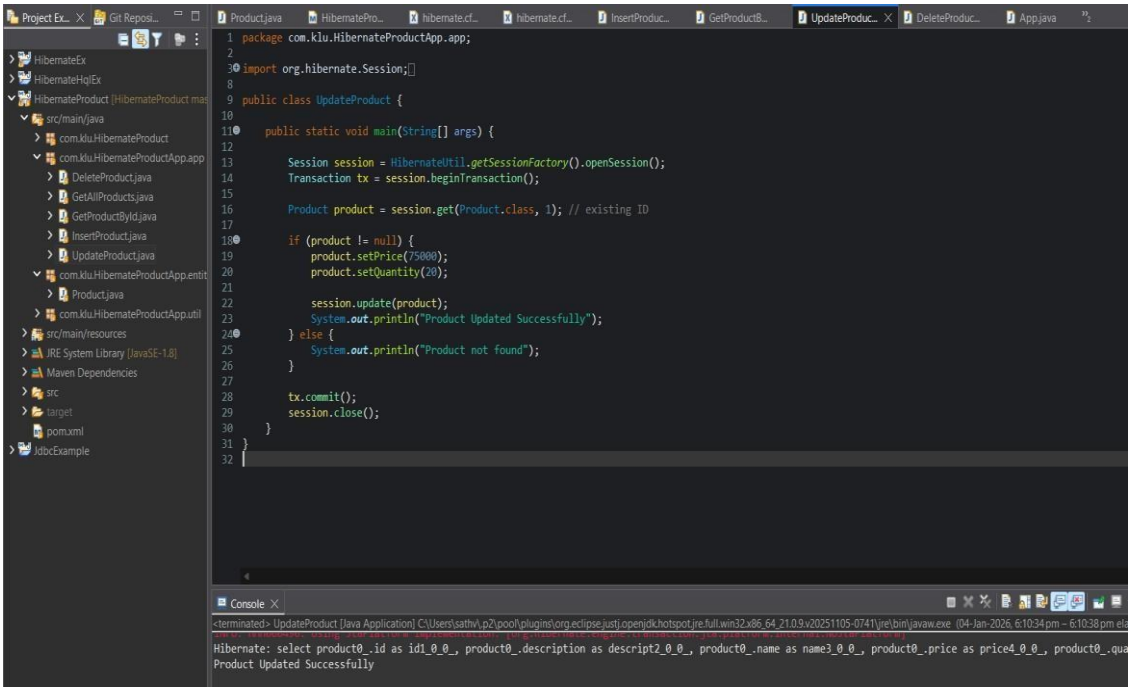
4. **Retrieve a product using its id.**

Output:-



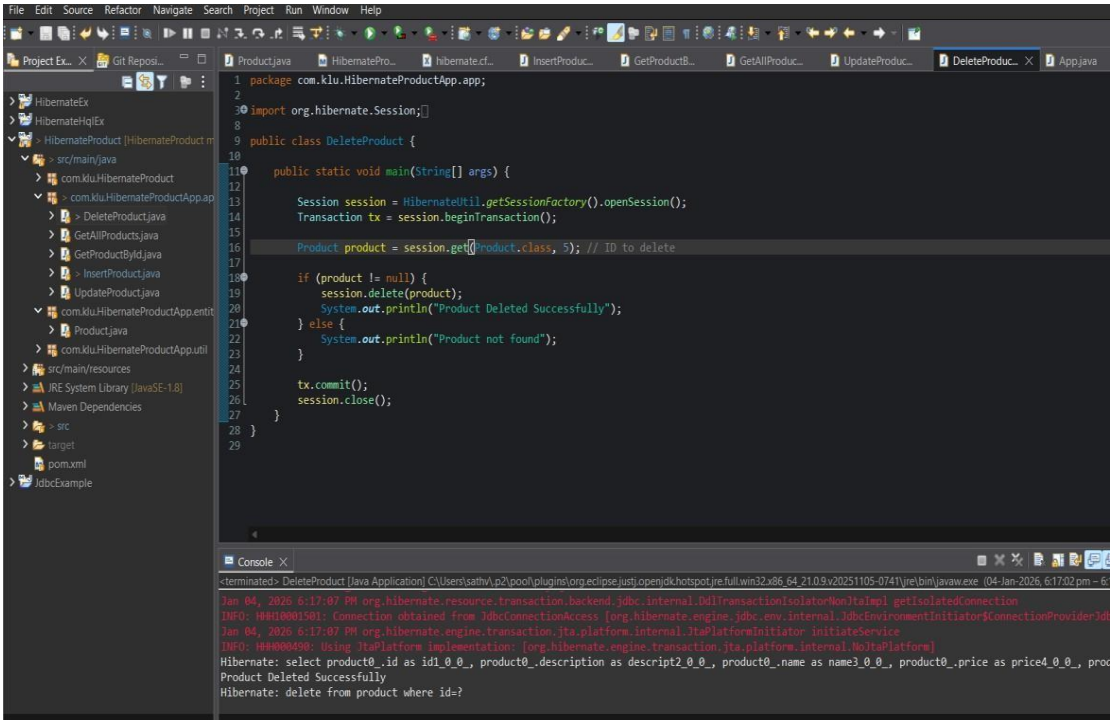
5. Update the price or quantity of any selected product.

Output:-



6. Delete a product record by id if it is discontinued

Output:-



7. a. Implement Hibernate ID generation strategies (AUTO, IDENTITY, SEQUENCE) inside the entity to observe how primary key values differ.

Output:-

```
<terminated> InsertProduct [Java Application] C:\Users\sathv\.p2\pool\plugins\org.eclipse.justj.openjdk.hotspot.jre.full.win32.x86_64
Hibernate: select next_val as id_val from hibernate_sequence for update
Hibernate: update hibernate_sequence set next_val= ? where next_val=?
Hibernate: select next_val as id_val from hibernate_sequence for update
Hibernate: update hibernate_sequence set next_val= ? where next_val=?
Hibernate: select next_val as id_val from hibernate_sequence for update
Hibernate: update hibernate_sequence set next_val= ? where next_val=?
Hibernate: insert into product (description, name, price, quantity, id) values (?, ?, ?, ?, ?)
Hibernate: insert into product (description, name, price, quantity, id) values (?, ?, ?, ?, ?)
Hibernate: insert into product (description, name, price, quantity, id) values (?, ?, ?, ?, ?)
Inserted Successfully
```

SQL File 4*

```
select * from product
```

Result Grid

id	description	name	price	quantity
1	HP	Laptop	75000	20
3	HP	Laptop	60000	5
4	Samsung	Mobile	30000	10
6	Samsung	Mobile	30000	10
7	HP	Laptop	60000	5
8	Samsung	Mobile	30000	10
9	Apple	Tablet	45000	7
10	HP	Laptop	60000	5
11	Samsung	Mobile	30000	10
12	Apple	Tablet	45000	7
NULL	NULL	NULL	NULL	NULL

b. The ID can be manual or auto generated, based on your chosen strategy.

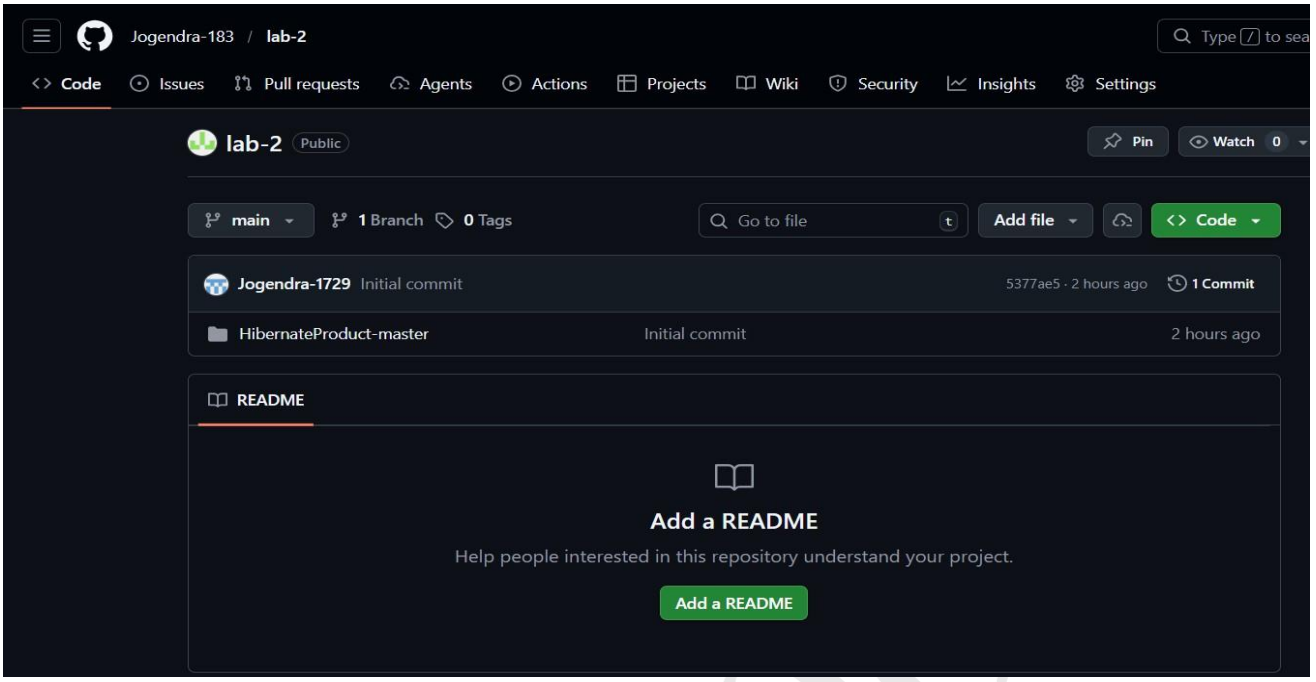
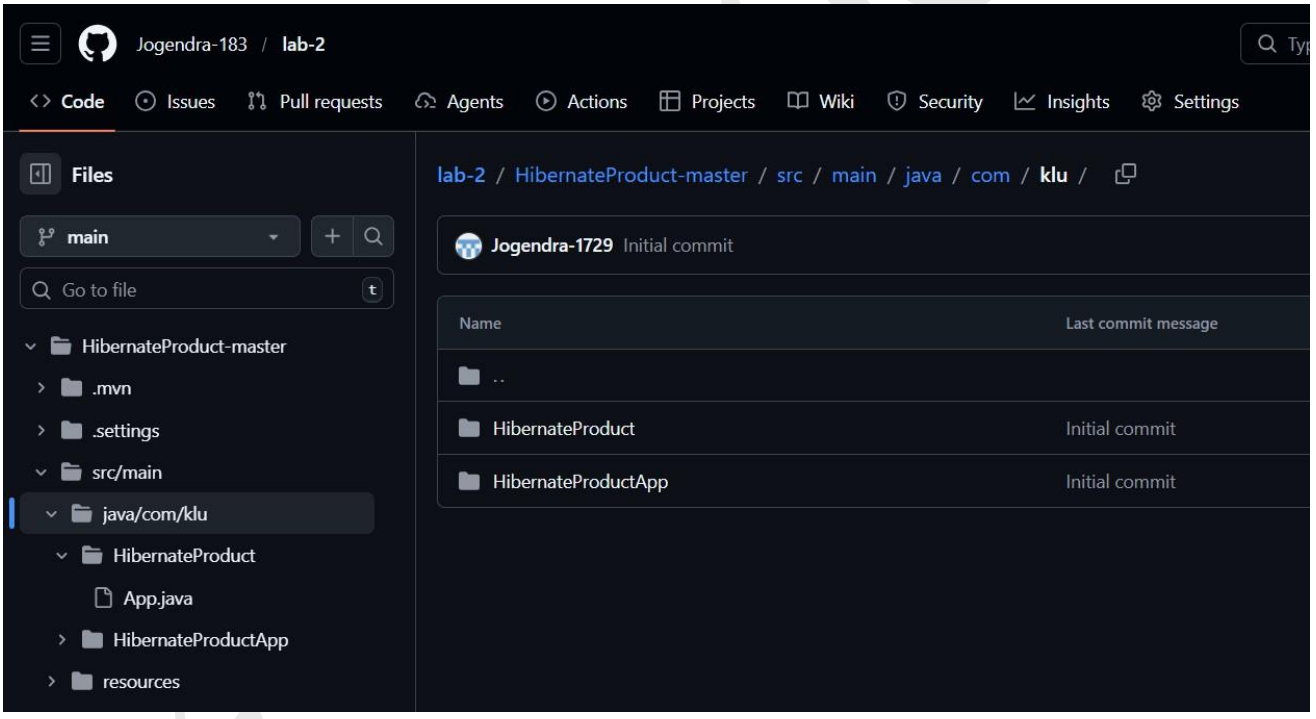
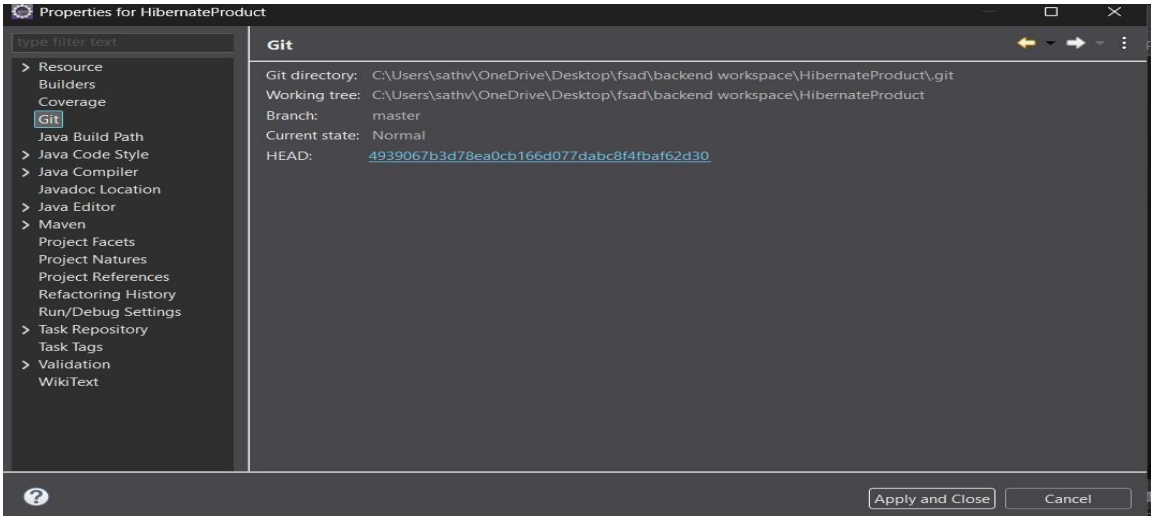
8. **Push the Hibernate project into a single GitHub repository**







Conclusion

This experiment successfully demonstrated the implementation of complete CRUD operations using Hibernate with JPA annotations for a retail inventory system. By mapping the Product entity to a database table and performing create, read, update, and delete operations, we validated how Hibernate simplifies database interaction through ORM. The use of different ID generation strategies (AUTO, IDENTITY, SEQUENCE) helped in understanding primary key management in real-world applications. Overall, this exercise strengthened practical knowledge of Hibernate configuration, entity mapping, and database operations, which are essential for building scalable Java-based enterprise applications.
